

## **HEAD AND NECK:**

- Prep: None
- Basic Principles: Use the highest frequency transducer possible for proper penetration.
- The examination should include the following:
  - The area of concern in grayscale and with color Doppler if appropriate.
  - One longitudinal and one transverse image of the right and left thyroid gland.
  - One transverse image of the right and left submandibular gland and parotid gland.
  - A cine clip of the right and left jugular chain lymph nodes.
